

# Download packages needed

[Download Rocky Linux 9.8](#)

[Download VirtualBox for Windows](#)

[Download putty.exe for Windows](#)

## Load Virtual Box by running the exe that downloaded for it

*If VirtualBox will not load, this is the C++ redistributable you need*

[Download C++ redistributable](#)

After the install is complete, you have to answer it installed correctly

## Creat Virtual Machine for Docker

### Add New virtual Machine

Run Virtual Box

- Click Machine >> New

```
VM Name    MyRocketSoftwareDockers
VM Folder  <take default>
ISO Image  c:\...\Downloads\Rocky9....iso
[Next]
  User Name  dockeradmin
  Password   Rocket123!
[Next]
  Base Memory  4096
  Number of CPUs  1
  Disk Size    60 GB
[Next] [Finish]
```

### Mount Rocky9 iso and restart

It will fail to boot, until you load the ISO

- Devices>>Optical drive

```
click on the Rocky9 iso
click Machine>>Reset
Up arrow to Install Rocket Linux 9.8 and press Enter
Highlight English and English(United States) [Continue]
Installation Destination [Done]
User Creation
```

```
Full Name  Docker Admin
User Name  dockeradmin
check both Make this user administrator and Require a password to use this account
Password   Rocket123!
Confirm    Rocket123!
[Done]
[Begin installation][Reboot]
```

## Turn new machine off

- Machine >> Shutdown

## Check Host-Only Network adapter address

- File >> Tools >> Network

See what address the VirtualBox Host-Only Ethernet Adapter has, mine was 192.168.56.1

## Add a network adapter to the MyRocketSoftwareDockers VM

- Settings >> Network >> Adapter 2

```
Attached to      Host-only Adapter
```

```
## Start virtual machine and configure second network adapter
```

```
* Login as dockeradmin
* Click on 9 dot square
* Settings >> Network and change second adapter
```

IPv6 Disabled

IPv4 Manual Address 192.168.56.2 Netmask 255.255.255.0 Gateway

## Putty to new machine and setup for docker images

- Copy putty.exe from Downloads to your desktop
- Connect to new machine with putty

Host Name (or IP address)

```
dockeradmin@192.168.56.2 [Open]
```

## Stage the new Docker VM

1. Turn off Selinux

```
sudo sed -i 's/^SELINUX=enforcing/SELINUX=disabled/' /etc/sysconfig/selinux
```

2. Disable and stop firewall

```
sudo systemctl disable firewalld.service sudo systemctl stop firewalld.service
```

3. Load docker, git and telnet

```
sudo dnf -y install docker git telnet
```

4. Create dockers directory

```
mkdir -m777 /home/dockeradmin/dockers
```

Put each docker build in a separate sub-folder Leave the zips for them in the dockers directory

5. Create a directory for the docker files on the host

```
mkdir -m777 /home/dockeradmin/PBD (for Pickleball Docker)
```

6. Add ssh key to be able to communicate with github later

```
ssh-keygen -t rsa Just press return through all the prompts.
```

7. Reboot system for changes to take affect

```
sudo shutdown -r now
```

## Setup GitHub

Connect to the new VM GUI and run Firefox [fire Icon on the bottom left] Click activities on the top left if nothing shows on the bottom

Login to github in Firefox on the Docker VM <https://github.com/login>

You may need to register with your email the first time

## Download the Pickleball Docker build zip

[https://github.com/MVMentees/MV-Dockers/blob/main/build\\_universe-pickleball.zip](https://github.com/MVMentees/MV-Dockers/blob/main/build_universe-pickleball.zip)

Click the download icon on the right side of the grey highlighted bar

This download the file to the /home/dockeradmin/Downloads directory

## Add the VM Docker ssh key to your github

2. On a second tab on FireFox, call up your public ssh key

```
file:///home/dockeradmin/.ssh/id_rsa.pub
```

Select all with <Ctrl>A, then copy with <Ctrl>C

3. Back in the github site tab, add ssh key to github

```
Click on profile on the right top of the screen
Settings >> SSH and GPG keys [New SSH key]
Title      My Docker VM
           Paste key from copy above
[Add SSH key]
```

## Load Pickleball Repo

Add Pickleball repo to your home directory

Login to the Docker VM with putty or use terminal from the GUI desktop

```
git clone git@github.com:MVMentees/Pickleball.git
```

## Create the docker for universe-pickleball

Copy the docker zip to the dockers directory

```
`cp /home/dockeradmin/Downloads/build_universe-pickleball.zip  
/home/dockersadmin/dockers/.`
```

Make the directory for the universe-pickleball docker build

```
`mkdir -m777 /home/dockeradmin/dockers/universe-pickleball`
```

Unzip the zip file

```
`cd /home/dockeradmin/dockers/universe-pickleball`  
`unzip ../build_universe-pickleball.zip`
```

Add the UniVerse TE release

This has to be requested [here](#) and they will email it to you. Either using scp or winscp or using a email client using Firefox, you need to get the UVTE...zip file into this same directory.

Build the docker image

```
`docker build -t universe-pickleball .`
```

See the readme for details on how to run the new docker image
